

Exercises on Wildcards in Java Generics

1. Write a generic method `printList` that takes a `List<?>` and prints all elements, regardless of their type. Then call it using:

- A list of Integer
- A list of String

2. Create a method `sumList` that accepts a list of any subclass of `Number` and returns the total sum.

3. Write a method `addNumbers` that takes a `List<? super Integer>` and adds integers from 1 to 5.

Example Code:

```
import java.util.*;
```

```
public class LowerBoundExample {  
    public static void addNumbers(List<? super Integer> list) {  
        for (int i = 1; i <= 5; i++) {  
            list.add(i);  
        }  
    }  
}
```

```
    public static void main(String[] args) {  
        List<Number> numbers = new ArrayList<>();  
        addNumbers(numbers);  
        System.out.println(numbers);  
    }  
}
```

4. Define a class `Box<T>` that holds an item. Then write a method `displayBox` that accepts any `Box<?>` and prints the item.
