

1. Write a program that prints the numbers 10, 20, and 30 in a single line using `printf()`.
2. Print the value of π with 2, 4, and 6 decimal places.
3. Use `printf()` to print two names left-aligned and their scores right-aligned in columns.
4. Display a salary of 1200000 using commas as thousand separators.
5. Format the same number for US and France locales using `printf()`.
6. Display the same amount (1999.99) in US, France, and Japan currencies.
7. Use `printf()` to print +123.45 with zero-padding in a field width of 8.
8. Create a product table with columns: Name, Qty, and Price, using proper spacing.
9. Read a number formatted in French locale (e.g., 3,14) and print it in US format.
10. Display the current date and time using `printf()` and different locales.
